A fictional randomised comparison of explanation access during revision

Fictional Team Elm | Entirely fictional | Local identifier REC-005

Abstract and scope

This is page 1 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Background

This is page 2 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Protocol and questions

This is page 3 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Method

This is page 4 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Measures and evidence boundaries

This is page 5 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Method - allocation

A seeded fictional random-number list allocated 80 participant codes equally before the interface opened. The list, seed, and assignment receipt were frozen before any fictional outcome was inspected.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Results

This is page 7 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Interpretation

This is page 8 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Limitations

This is page 9 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Results - Table 3: primary outcome

Available cases and the authored interval are shown below. Missing outcomes remain visible and no subgroup effect was preregistered.

Table 3. Primary fictional outcome with attrition visible

group	allocated	available	mean	SD
optional explanation	40	36	3.6	0.5
suggestion only	40	38	3.3	0.6
mean difference	-	74	0.30	fictional 95% interval 0.05 to 0.55

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Disclosure

This is page 11 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Reproduction notes

This is page 12 of an entirely fictional record created for Course 17. It exists so learners can distinguish a locator from primary evidence, preserve denominators, and calibrate claims to design. No person, institution, publication, observation, quotation, or result is real. Any extraction must name this PDF, the exact page, the relevant table or paragraph, and a verification decision.

Verification boundary: use this PDF page as the primary object; extracted JSON and RAG chunks are locators only.

Not citable as real research. No factual, causal, legal, or policy claim is authorised.

Limitations

Six participant codes lacked the primary outcome; no subgroup effect was preregistered. The synthetic result cannot establish a real effect, mechanism, safety claim, or decision threshold.
